THE EARRINGS

Cut to catch every *last* ray of light

These earrings pair the generous softness of the cushion brilliant cut — all rounded corners and pillowy depth — with the rarity of tanzanite, found in a single place on Earth near Kilimanjaro. Set in rhodium-polished platinum, they sit quietly at the lobe and demand every glance in the room.

Cushion Brilliant Cut
Soft corners and a rounded square outline — maximum fire from every angle.

Classic Four-Prong Basket
Four delicate platinum claws lift the stone high, letting light enter from beneath.

Lustrous Platinum Mount
Naturally white, hypoallergenic, and more durable than gold — the fitting choice for a stone this vivid.

Screw or Push Back
Choose the screw-back for travel and higher carats, or push-back for effortless daily wear.

DIAMOND KNOWLEDGE

Understanding the *4Cs*

C

Cut

The cushion brilliant cut features larger facets than a standard round, producing deep flashes of colored light unique to tanzanite's trichroic nature.

C

Color

Tanzanite ranges from lavender-blue to deep violet-blue. The finest stones show a rich velvety blue with violet overtones — rarer than sapphire.

C

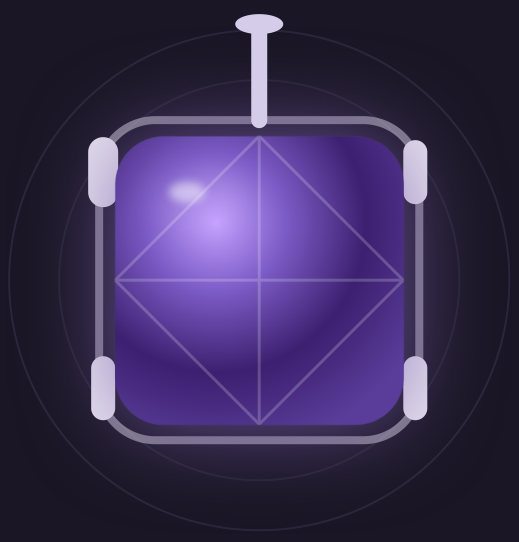
Clarity

Lab-grown tanzanite is produced under controlled conditions, achieving eye-clean clarity that would be exceptionally rare in a natural stone.

C

Carat

Available from 0.5 ct to 10 ct total weight per pair. A cushion cut reads larger than its carat weight suggests — bold presence at the lobe.



CONSTRUCTION

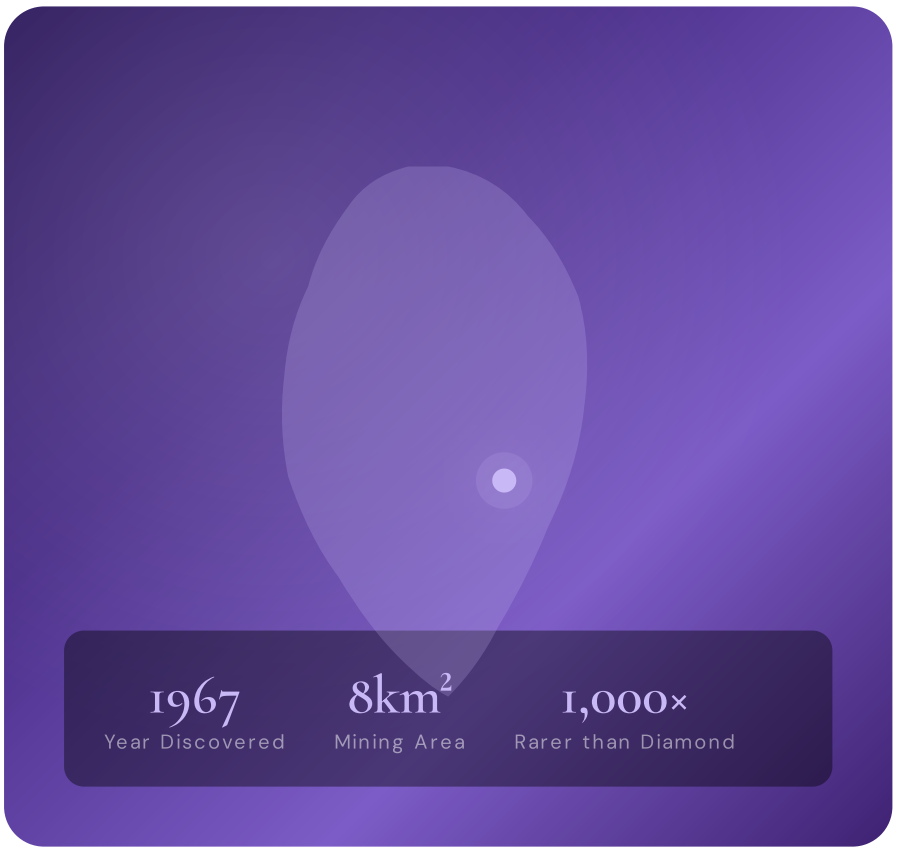
The four-prong *basket setting*

A timeless choice: four platinum claws grip the stone at its corners, leaving the sides open to light. The basket sits slightly elevated so the stone's pavilion floats free — letting illumination enter from beneath and amplify every facet.

Setting type	Four-Prong Basket
Metal	Platinum (Pt 950)
Shape	Cushion Brilliant
Diamond type	Lab-Grown
Style No.	894
Closure	Screw Back / Push Back

THE STONE

Tanzanite — born once, *near Kilimanjaro*



Discovered in 1967 in the Merelani Hills of northern Tanzania, tanzanite exists in a single deposit on Earth. Its extraordinary trichroism — showing blue, violet, and burgundy simultaneously depending on angle and light — makes it unlike any other gem. The finest specimens rival the most prized blue sapphires at a fraction of the price.

Our tanzanites are lab-grown under the same conditions that produce them in the Earth: precisely controlled heat and pressure, without the mining footprint. Identical in chemical structure, optical properties, and hardness to their natural counterparts — ethically sourced as a matter of principle.
